

Kenwood USB CAT Cable

Converts Kenwood CAT ACC1 serial DIN connector to USB for modern PCs without serial ports. FTDI module is a tiny naked PCB already mounted to a USB "A" connector. PCB contains FTDI chip, RS-232 level shifter and TXD/RXD LEDs. This board uses the same drivers as regular FTDI USB<-->serial dongles.

Note that this premade assembly is different from the usual serial<-->USB dongles, in that the active conversion circuitry is at the USB end rather than in the shell of the serial DB9 end. This allows any kind of plug to be attached to the serial end.

Just solder on wires and cover with translucent (so the LEDs can show) shrink-sleeving, or the case from a dead flash drive.
